

Aside with images - Galery

You will receive a base html. DO NOT MODIFY THE HTML FILE! You have to create a CSS and a JS file.

CSS

The aside should occupy 25% of the document (width).

The section should occupy 75% of the document (width).

The aside and the section should occupy the 100% of the height of the viewport. If the images occupy more than the 100% of the height only the aside has to be scrollable (see last image).

The text should appear in the bottom of the div. It should also appear over the image (with some transparency so the image can be seen).

The image should adapt to the divs size.

JS

When the user passes the mouse over the aside img elements, the background image of the div in the section should show that image. The span inside the div should show the "alt" of the image.

When the mouse is not over an image anymore, the content of the section must be initialized.
